Introduction

How do we make sense of other people's behavior?

Introduction

How do we make sense of other people's behavior?

- Why did you sleep late last night?

Introduction

How do we make sense of other people's behavior?

- Why did you sleep late last night?
- Why did you sign up for this course?

Introduction

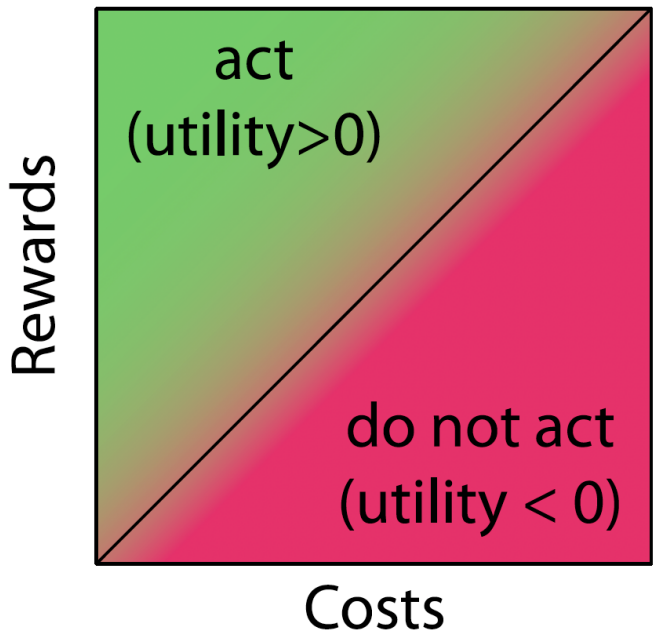
How do we make sense of other people's behavior?

- Why did you sleep late last night?
- Why did you sign up for this course?
- Why did you choose to eat out instead of cooking?

Naive Utility

$$\text{Utility} = \text{Rewards} - \text{Costs}$$

- There is empirical support that humans intuitively use utility-based reasoning to make sense of other people's behavior



Naive Utility Calculus

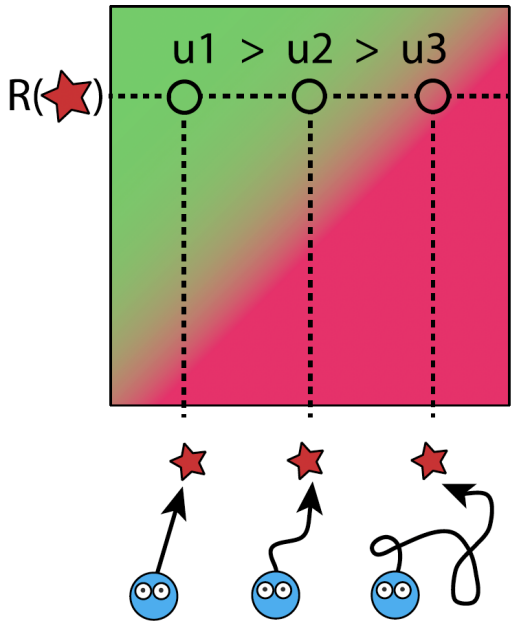
$$U(p, o) = R(o) - C(p)$$

- $U(p, o)$: utility expected from acting according to plan p to reach outcome o
- $R(o)$: subjective reward the agent expects from outcome o
- $C(p)$: subjective cost of executing plan p

Caveats

- **Descriptive, not normative:** This is not about how people *should* make decisions (economic utility theory)
- **How we actually operate:** This describes how we *intuitively* make sense of other people's behavior
- People don't explicitly compute utilities when they act - this is the cognitive framework we use to understand others

Utility and Efficiency



- More efficient paths are less costly and therefore produce higher utilities
- When agents act, they will fulfill their goals as efficiently as possible to maximize utility

Graded Preference Inference

Table of Contents

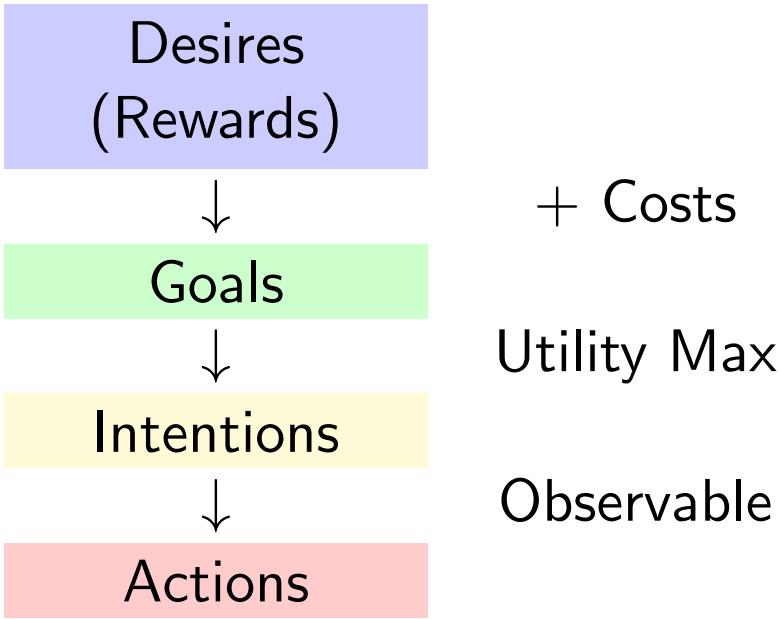
Hierarchical Mind Model

Level	Component	Observable?
4	Desires (Reward functions)	No
3	Goals (World states)	No
2	Intentions (Goal sequences)	No
1	Actions (Behaviors)	Yes

$\downarrow$ **Inference Direction** $\uparrow$

Generative Process



MDP Planning per Goal

Goal: Reach Object A

$$V^*(s) = \max_a \sum_{s'} P(s'|s,a)[R(a,s) - C(a,s) + \gamma V^*(s')]$$

Policy: $p(a|s) \propto \exp(\sum_{s'} P(s'|s,a)V^*(s')/\alpha)$

Each goal $\rightarrow$ Separate MDP $\rightarrow$ Efficient path

The Inference Problem

Hidden
Costs &
Rewards

Actions

Forward

$\longleftarrow$

Bayesian Inference

$$p(C, R|A) \propto p(A|C, R) \cdot p(C, R)$$

Two Types of Rationality

Type	**What**	**Formula**
Rational Choice	Intention selection	$p(I\|C,R) \propto \exp(U(I)/\beta)$
Rational Action	Efficient execution	$p(A\|I)$ via MDP policy

Likelihood: $p(A|C,R) = \sum_I p(A|I) \cdot p(I|C,R)$
